

Assessments > Site Assessment

Is your company's site at a level of resiliency that is required by your business?

ITC's site Assessment (SA) offering is designed to focus on continuity of operations, resiliency, vulnerability and mitigation measures and the risk management process as it applies to a specific critical site. Our proven SA methodology is used to identify potential problem areas - such as business risk, asset risk or overall corporate risk - risks that could have a serious impact on business operations or functional capabilities. A recommended course of action is developed to mitigate the identified risks and build site resiliency.

The ITC team will identify and document possible single points of failure and recommend actions for risk mitigation, and infrastructure improvement. We will also discuss the internal and external political, social, economic and environmental factors.

During our on-site walk-thru we will take digital pictures of visible potential single points of failure. These photographs will be included in your Site Assessment Report.

We will also conduct on-site review interviews with department managers - such as your Information Technology Manager or your Information Systems Management Team - and other operations personnel that have knowledge about your site. The interview process will examine the Social, Political, Operations, Economic and Environmental issues related to the development and implementation of a comprehensive Business Continuity Plan.

Let our certified risk management consultants - consultants that have extensive first-hand experience in preparing for, responding to and managing crisis events - help you assess your company's site(s) resiliency and your overall risk management process.

ITC is your Total Protection Solutions Provider.
